

An Analysis of Energy Efficient Building Principles

Craig Anthony Blackstone

2005

9709225V

A project report submitted to the School of Construction Economics and Management,
University of the Witwatersrand, Johannesburg, in partial fulfillment of the requirements for
the Masters Degree in Property Development and Management

Johannesburg 2005

Declaration

I declare that this research report is my own, unaided work. It is being submitted for the Degree of Masters in Property Development and Management in the University of the Witwatersrand, Johannesburg. It has not been submitted before for any degree or examination in any other University.

(Craig Anthony Blackstone)

24th day of November 2005

Acknowledgments

The Author expresses sincere appreciation to all of the following people who gave of their precious time;

Dr Alfred Talukhaba

Professor François Viruly

Ken Stucke (Architect)

Mark Napier (CSIR)

Dr Daniel Irurah

Moses Mengu (Managing Director: BOTECH)

Busisiwe Sianga (BOTECH)

Nick Ndaba (BOTECH)

A special thanks to the Wits library staff for their assistance.

Abstract

This research was conducted in order to highlight the misconception that there may be a single answer to the challenges of energy efficient design; a “single elixir that will be the answer to all problems” (Holm, 1996).

Existing literature pertaining to energy efficient design principles was analysed and tested against a well known example of Southern African energy efficient building practice; the Botswana Technology Centre (BOTEC). BOTEC was selected as the case study for this investigation because it was designed to be a living exhibition of energy efficient design and as such a manual or ‘elixir’ for alternate design.

BOTEC was analysed on site, personal interviews were held with the architect and a questionnaire was circulated to the users of the building in order to observe whether the principles used at the BOTEC building are appropriate and represent the “single elixir, the answer to all problems,” with regard to energy efficient design (Holm, 1996).

Although BOTEC appears to perform well, interviews with the users of the BOTEC building suggest that the building does not perform well in winter at all. Interviews with the architectural consultant who worked on the BOTEC building expose a simple oversight in design which leads to ‘this building’s underperformance in winter’.

In concurrence with Holm therefore, this report ultimately shows that there are no perfect solutions to energy efficient design and by applying a once successful solution without taking cognisance of specific climatic and geological differences, the building will not function correctly.

Abstract	iv
Table of Contents	v
List of Tables	viii
List of Figures	ix
List of Graphs	x
Chapter 1.0 Introduction	01
Hypothesis	01
1.1 The Problem	01
1.2 Research Objectives	02
1.3 Scope of Study	03
1.4 Resource Depletion	04
1.5 Sustainability	06
1.6 Energy Efficient Design	07
Chapter 2.0 Literature analysis of Energy Efficient Building Principles	08
2.1 Historical Overview of Climatic Building Design	08
2.1.1 Building Envelope	09
2.1.2 Temperature Control, Lighting and Ventilation	10
2.1.3 High Rise and Air Conditioning	12
2.1.4 Common Oversights	14
2.2 Contemporary Design for Energy Efficiency Buildings	16
2.2.1 Economics of energy efficient design	18
2.2.2 Building Envelope Design.	21
